Currency format in php with examples. Currency format examples.

This tutorial shows, how to build a simple Currency Converter Application in the C# Programming Language. The program allows the user to calculate currency exchange rates, using the available online data provided by the European Central Bank. Install Visual Studio IDE Step 1 : Download Visual Studio Installer Visit visualstudio.microsoft.com and navigate to the Windows Download Page Select either the Professional, Community or Enterprise Edition and press the download button. If you're an individual programmer or a small team, then i would recommend, downloading the free community edition Step 2 : Run The Visual Studio Installer When you have downloaded an installer of your choice, run it by double clicking the downloaded file. An installer dialog will appear on your screen. In the Workloads Tab view, Select .NET Desktop Development if you want to develop for the Windows Desktop Create New Console Application Project With Visual Studio Step 1 : Create New Project Select C# in the language tab And then select Console App (.NET Framework) and press the NEXT button You can then proceed to give your project a Project Name Press the CREATE button, After you have given a name to your project Building the Currency Converter Application for C# The following code example is a C# version of the Currency Converter Application. The program allows to user to calculate currency exchange rates and uses online data from the European Central Bank. Exchange Rate XML Schema The european central bank, publishes an RSS Feed with the daily exchange rate between the EURO, and all other currencies. RSS is XML-formatted plain text. The RSS format itself is relatively easy to read both by automated processes and by humans alike. An example feed from the Euro to USD exchange rate will have contents such as the following: Online XML Example European Central Bank `<terms:license> name('post.show'); Route::get('/posts/show-post/{id}/{name}'; {email protected} _post' -> name('post.show'); Define Controller Method With Multiple Parameters Now we will learn to define a controller method accepting multiple parameters. Syntax (Controller Method):- Below is basic syntax for controller method accepting multiple parameters as below: public function somemethod($paramter1, $paramter2){ //my code } public function somemethod($paramter1, $paramter2){ //my code } Example:-`
